

MATH 20250

Prof. Lanier

There are two ways you can run the Mathematica apps that I've uploaded here.

1) You can [download Wolfram Player](#), which is easy to set up and free to use. Just download, click to run the installer, and follow the directions. Wolfram Player can read and run Mathematica files, but you can't write new code in it. You can also use it to view apps from the [Wolfram Demonstrations Project](#), including these ones about [linear algebra](#).

2) You can [get a copy of the full Mathematica program](#) for free as a UChicago student. Just follow the steps at that link. Having Mathematica will allow you to make modifications to apps other people have made, as well as to code mathematics of your own. Mathematica has great documentation and it's pretty easy to get started with, even if you have little or no prior coding experience. Using Mathematica would be one way to create a piece of linear algebra software, which is one of the flex options.

Let me know if you need any help with either of these!

—Prof. Lanier
